
Bridging the Physical and Digital Worlds: Control Technologies for Factories of the Future and Green Energy Solutions

Dr. Miha Glavan

The field of Control Technology

Control technology (**automation, cybernetics, informatics**) is distinctive infrastructural **enabling technology** that is included in practically all modern devices, machines, processes and systems with the task of ensuring their **functionality, reliability, safety and operational efficiency**.

Key research development directions

New building blocks for
Integration physical and digital
world in factories of the future

- New generation of **sensors & communication interfaces**
- Development of autonomous software **agents with self-learning abilities**
- Production **data spaces** and **secure data sharing**

Development of new procedures
for real-time monitoring and
management of production
processes

- New approaches to **extract hidden information** from measured data, identification of mathematical models
- Focus on: (i) **production models** for a specific product segment, (ii) agents for **insight into unmeasurable** (hidden) process states, and (iii) **predictive control and optimization**

Control technologies in green
energy solutions

- **Electrification** of technological processes
- Use of **hydrogen technologies** for storage, conversion, distribution and energy supply
- Development of **energy management** procedures including RES, energy conversion & distribution

Prioritized Technological Areas

Artificial intelligence for control and optimization of

systems

- Production **automatization**
- **Quality** and process control
- Optimization of **energy efficiency**
- **Adaptive** manufacturing
- **Workforce** management

Digital twins in technical processes

- **Reorganization** and **optimization** of production processes
- **Internal logistics** and **scheduling**
- **Connectivity** with the live data/process

Energetics in complex systems

- **Techno-economic optimization** of energy building blocks
- Industrial participation in **grid balancing**
- **Hydrogen prosumer** and renewables

Predictive maintenance

- **Detecting changes** in equipment function
- Monitoring the **condition** of equipment/machinery
- Estimation of **indicators** of **equipment** wear and tear
- Supporting **maintenance planning**

Industrial IoT

- New **IIoT solutions** for data collection, analysis and distribution
- Data collection, **AI integration**, remote management and **improved control** of processes

Integrated MES

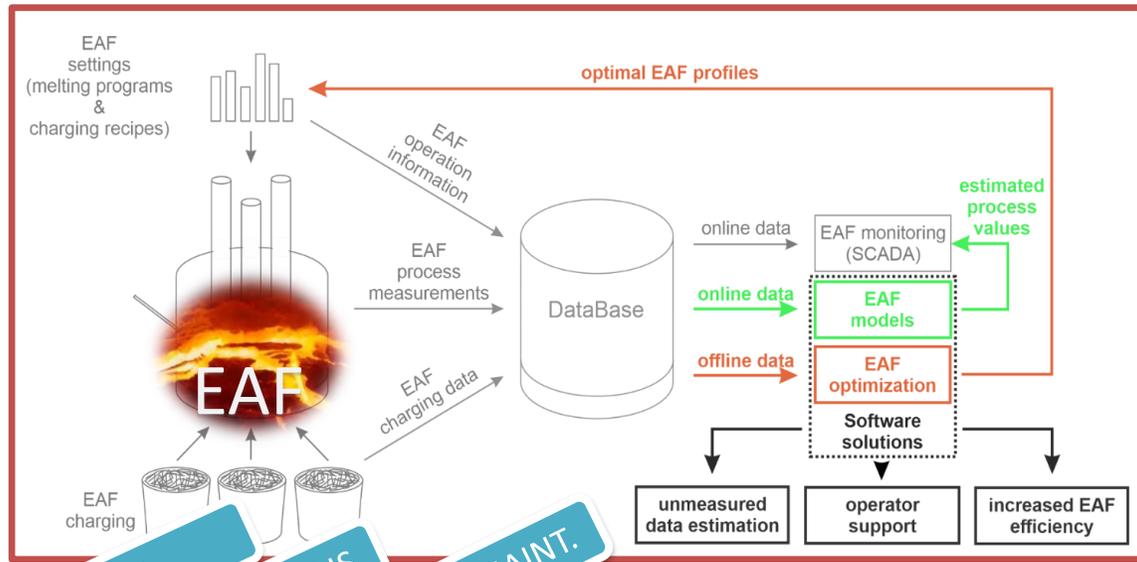

- Flexible **data integration** and data management
- Improved **functional integration** with other production IT systems
- Development of **new MES/MOM functionalities** (quality, scheduling, maintenance, ...)

Autonomous mobile systems*

*joint topic with robotics

- **autonomous logistics** in spatially limited areas
- **internal logistics** and
- autonomous **adaptation of production lines**
- environmental monitoring

Optimization and performance improving in metal industry by digital technologies

AI
DIGITAL TWINS

Started in September 2024
SEAMLESS DIGITAL INTEGRATION
IN STEEL VALUE CHAIN FOR
HIGH QUALITY FINAL PRODUCTS

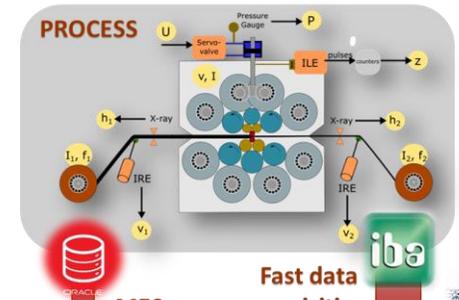

HORIZON-CL4-2024-TWIN-TRANSITION-01
Project number: 101178919
Project acronym: SMARTChain
Project duration: 36 months
Partners: 14, Countries: 7

SMARTChain
www.smartchain-project.eu

Alarms / equipment condition

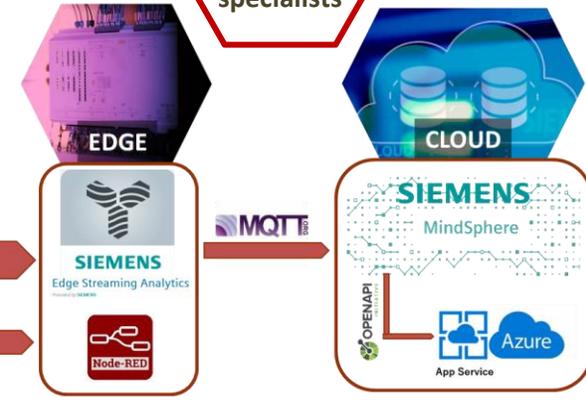

sij | acroni **Jožef Stefan Institute**
Ljubljana, Slovenia

SIEMENS **University of Ljubljana**
Faculty of Electrical Engineering

Fast data acquisition system
Capability to monitor more than 700 process variables, producing daily more than 4 GB of data

H2020 Call: DT-SPIRE-06-2019
Start date: 2019-01-10
Duration: 42 Months
Coordinator: Jožef Stefan Institute

<https://youtu.be/tKkxCOSgCb4>

Call: HORIZON-CL4-2022-TWIN-TRANSITION-01
Project reference: 101092069
Start/end: January 2023 – December 2025
Coordinator: POLITECNICO DI MILANO (POLIMI)

- 43 partners from 18 Countries
- 22 EU leading edge Regional Representatives
- 13 EU leading edge Technology Providers (10 SMEs)
- 7 Industrial Cases SMEs or MIDCAPS
- 2 open calls

(E)DIH Ecosystem and Collaboration Corridors

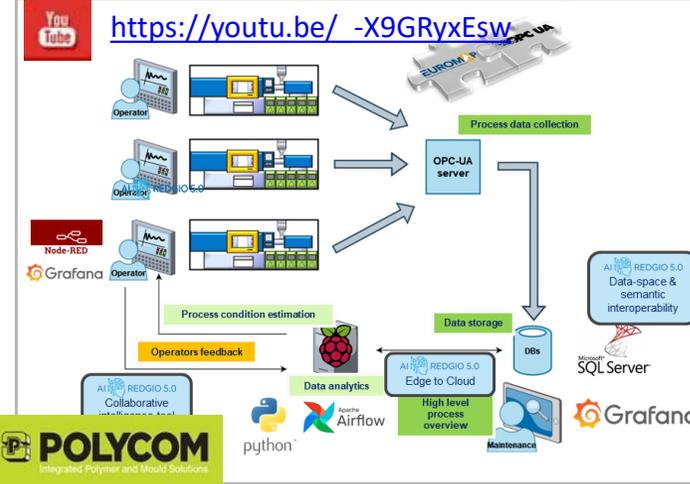

Didactic factories network

University of Ljubljana
Faculty of Mechanical Engineering

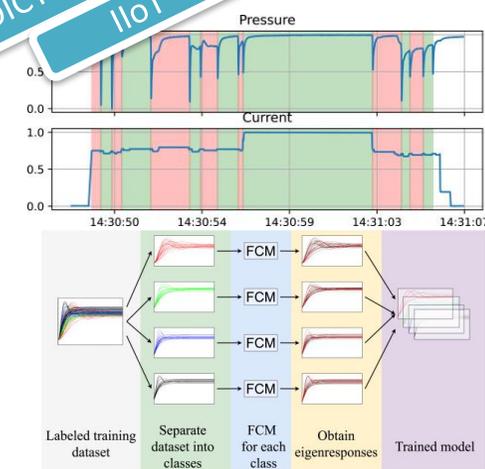

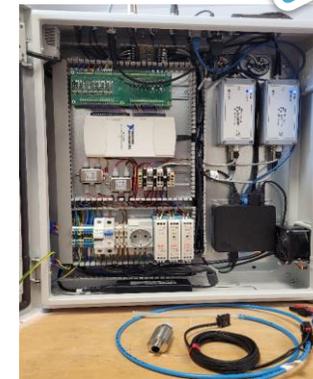

Continuous monitoring of moulding machines using AI at the edge

AI

DIGITOP: Digital transformation of robot-supported factories of the future*

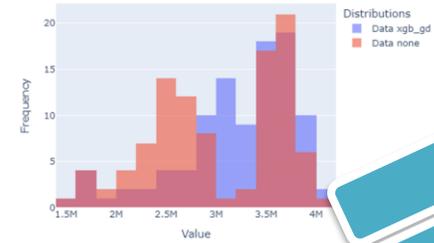

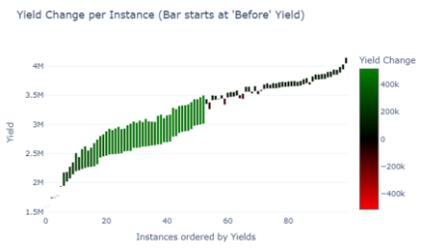

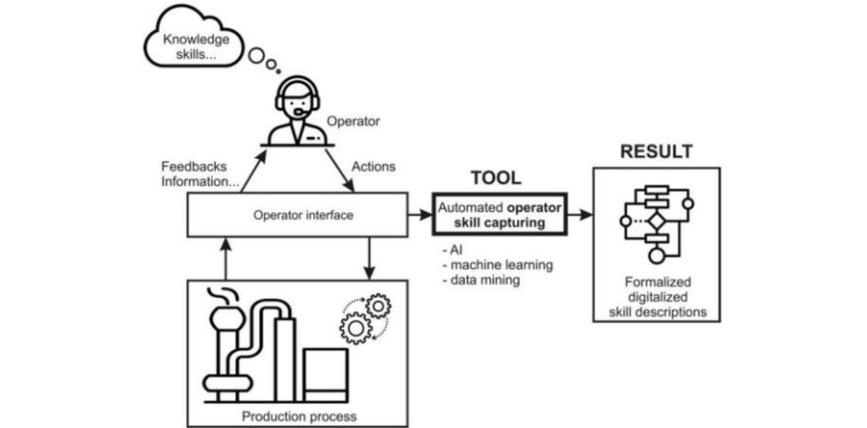

4th research and development area of the DIGITOP programme

* coordinated by robotics

Operator skill capturing and formalization

- Fluctuation of workforce pose a risk due to lost knowledge and skills
- To capture, formalize and digitize the specialized skills and knowledge of process operators detected from from historical process data

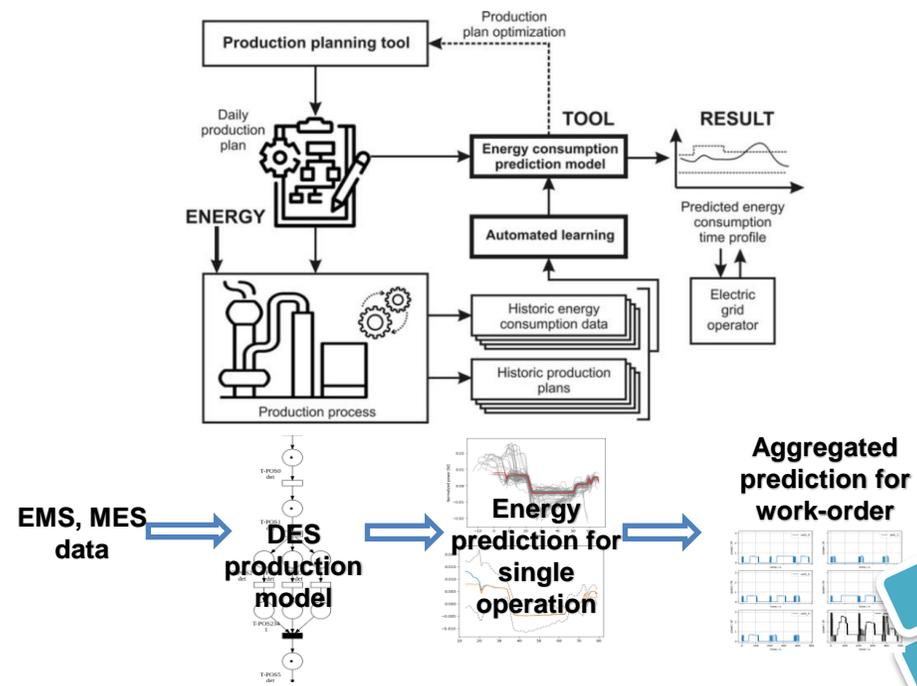

AI
Int. MES

Improved prediction of production energy needs

- More accurate prediction of energy needs provides means for more efficient energy management
- Identify predictive models from historical process data (MES, EMS)

Aggregated prediction for work-order

AI
Energetics
Int. MES

Internationalization activities

EFFRA & MiE

Involved as EFFRA member, represented in MiE members board and WGs

A.SPIRE & Processes4Planet

Involved in transversal Digital working group, Energy working group and Process optimization working group.

Hydrogen EUROPE & CLEAN Hydrogen Partnership

Involved in the area of green hydrogen.

Vanguard Initiative

Member of AI Pilot and in the process of joining to a new hydrogen pilot.

United Nations Industry Development Organization

Smart Manufacturing Innovation center

UNIDO AIIM Global Alliance

The international academy for production engineering

Tehnološki park 18, 1000 Ljubljana, Slovenia
